

Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus which can allow the individual driving to be able to work the lift truck without leaving the seat. They are made out of top quality materials and are designed to be able to endure the most demanding procedures and work environments. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate much more accurate carrying and placement in a faster and more effective way.

The unique fork pocket design could enable the person operating it to be able to securely sway the unit's blades without any worry of damaging the positioning cylinders. This can allow the operator the choice to either execute simultaneous or independent blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages could be transformed into fork positioners on available units.
